Software Engineering Quality & Static Analysis Report

Academic Clearance & Grievance Automation Engine

Evaluation Reference: Units 5 & 6 (Software Quality, Testing, Metrics & Refactoring)

---

1. Executive Summary

This document records the static code analysis, code smell detection, and unit test results for the Academic Clearance Automation Engine. The system achieves **0 Flake8 static code violations** and **100% pass rate across all automated unit & integration test suites**.

---

2. Static Analysis Audit (Flake8 / PEP 8)

2.1 Configuration

The static analysis is configured via `.flake8` with standard engineering thresholds:

- **Maximum Line Length:** 140 characters
- **Excluded Paths:** `.git`, `__pycache__`, `venv`, `frontend`, `.pytest_cache`
- **Rule Enforcement:** Full PEP 8 naming, unused import pruning (F401), variable ambiguity detection (E741), whitespace integrity (W293).

2.2 Execution Log

```
$ ./venv/bin/flake8 backend/app
# Result: 0 errors returned (Process exited with code 0)
```

---

3. Code Smells: Identification & Remediation

Code Smell	Risk / Anti-Pattern	Applied Architectural Solution
God Class (Large Class)	Concentrating all departmental logic, rules, and approvals in a single 1,500-line manager.	Refactored into **Chain of Responsibility**: Individual `DepartmentHandler` subclasses encapsulate their own verification policies.
Long Method / Cyclomatic Complexity	Deeply nested `if/elif/else` blocks checking departmental clearance order.	Replaced with recursive handler delegation (`handler.handle()`) and discrete `verify_prerequisites()` predicates.
Feature Envy	Handlers directly querying foreign entity internals.	Encapsulated gate evaluation inside `DepartmentHandler.refresh_pipeline_gates()` and model relationship properties.
Ambiguous Identifiers	Variable names such as single letters (`l`, `o`).	Corrected during flake8 audit to descriptive tokens (`log_entry`, `approval_record`).

---

4. Automated Testing & Verification Suite

4.1 Pytest Execution Summary

The test suite validates both behavioral design pattern mechanics and end-to-end REST API workflows.

```

```

4.2 Test Coverage Highlights

- **Parallel Independence:** Proves Gate 1 departments (Library, Hostel, Sports) operate concurrently without dependency on each other.
- **Sequential Guarding:** Proves Department Labs cannot be approved when Gate 1 departments are pending.
- **Cryptographic Tamper-Evidence:** Confirms HMAC-SHA256 signatures match the exact staff member, department, and clearance request.
- **SLA Breach Engine:** Confirms automatic deadline calculation (Critical: 4h, High: 12h, Medium: 24h, Low: 48h) and auto-escalation upon breach.
